

# Package ‘imbalance’

October 13, 2022

**Type** Package

**Title** Preprocessing Algorithms for Imbalanced Datasets

**Version** 1.0.2.1

**Maintainer** Ignacio Cordón <nacho.cordon.castillo@gmail.com>

**Description** Class imbalance usually damages the performance of classifiers. Thus, it is important to treat data before applying a classifier algorithm. This package includes recent resampling algorithms in the literature: (Barua et al. 2014) <doi:10.1109/tkde.2012.232>; (Das et al. 2015) <doi:10.1109/tkde.2014.2324567>, (Zhang et al. 2014) <doi:10.1016/j.inffus.2013.12.003>; (Gao et al. 2014) <doi:10.1016/j.neucom.2014.02.006>; (Almogahed et al. 2014) <doi:10.1007/s00500-014-1484-5>. It also includes an useful interface to perform oversampling.

**License** GPL (>= 2) | file LICENSE

**Encoding** UTF-8

**LazyData** true

**BugReports** <http://github.com/ncordon/imbalance/issues>

**URL** <http://github.com/ncordon/imbalance>

**Depends** R (>= 3.3.0)

**Imports** bnlearn, KernelKnn, ggplot2, utils, stats, mvtnorm, Rcpp, smotefamily, FNN, C50

**Suggests** testthat, knitr, rmarkdown

**RoxygenNote** 7.0.2

**VignetteBuilder** knitr

**LinkingTo** Rcpp, RcppArmadillo

**NeedsCompilation** yes

**Author** Ignacio Cordón [aut, cre],  
Salvador García [aut],  
Alberto Fernández [aut],  
Francisco Herrera [aut]

**Repository** CRAN

**Date/Publication** 2020-04-07 06:51:44 UTC

**R topics documented:**

banana	<i>Binary banana dataset</i>
--------	------------------------------

---

**Description**

Dataset containing two attributes as well as a class one, that, if plotted, represent a banana shape

**Usage**

```
banana
```

```
banana_orig
```

**Format**

**At1** First attribute.

**At2** Second attribute.

**Class** Two possible classes: positive (banana shape), negative (surrounding of the banana).

**Shape**

banana: A data frame with 2640 instances, 264 of which belong to positive class, and 3 variables

banana\_orig: A data frame with 5300 instances, 2376 of which belong to positive class, and 3 variables:

**Source**

[KEEL Repository](#).

---

ecoli1

*Imbalanced binary ecoli protein localization sites*

---

**Description**

Imbalanced binary dataset containing protein traits for predicting their cellular localization sites.

**Usage**

ecoli1

**Format**

A data frame with 336 instances, 77 of which belong to positive class, and 8 variables:

**Mcg** McGeoch's method for signal sequence recognition. Continuous attribute.

**Gvh** Von Heijne's method for signal sequence recognition. Continuous attribute.

**Lip** von Heijne's Signal Peptidase II consensus sequence score. Discrete attribute.

**Chg** Presence of charge on N-terminus of predicted lipoproteins. Discrete attribute.

**Aac** Score of discriminant analysis of the amino acid content of outer membrane and periplasmic proteins. Continuous attribute.

**Alm1** Score of the ALOM membrane spanning region prediction program. Continuous attribute.

**Alm2** score of ALOM program after excluding putative cleavable signal regions from the sequence. Continuous attribute.

**Class** Two possible classes: positive (type im), negative (the rest).

**Source**

[KEEL Repository](#).

**See Also**

Original available in [UCI ML Repository](#).

---

glass0

*Imbalanced binary glass identification*

---

### Description

Imbalanced binary classification dataset containing variables to identify types of glass.

### Usage

glass0

### Format

A data frame with 214 instances, 70 of which belong to positive class, and 10 variables:

**RI** Refractive Index. Continuous attribute.

**Na** Sodium, weight percent in component. Continuous attribute.

**Mg** Magnesium, weight percent in component. Continuous attribute.

**Al** Aluminum, weight percent in component. Continuous attribute.

**Si** Silicon, weight percent in component. Continuous attribute.

**K** Potassium, weight percent in component. Continuous attribute.

**Ca** Calcium, weight percent in component. Continuous attribute.

**Ba** Barium, weight percent in component. Continuous attribute.

**Fe** Iron, weight percent in component. Continuous attribute.

**Class** Two possible glass types: positive (building windows, float processed) and negative (the rest).

### Source

[KEEL Repository](#).

### See Also

Original available in [UCI ML Repository](#).

---

haberman

*Haberman's survival data*

---

### Description

The dataset contains cases from a study that was conducted between 1958 and 1970 at the University of Chicago's Billings Hospital on the survival of patients who had undergone surgery for breast cancer.

### Usage

haberman

### Format

A data frame with 306 instances, 81 of which belong to positive class, and 4 variables:

**Age** Age of patient at time of operation. Discrete attribute.

**Year** Patient's year of operation. Discrete attribute.

**Positive** Number of positive axillary nodes detected. Discrete attribute.

**Class** Two possible survival status: positive (survival rate of less than 5 years), negative (survival rate or more than 5 years).

### Source

[KEEL Repository](#).

### See Also

Original available in [UCI ML Repository](#).

---

imbalance

*imbalance: A package to treat imbalanced datasets*

---

### Description

Focused on binary class datasets, the `imbalance` package provides methods to generate synthetic examples and achieve balance between the minority and majority classes in dataset distributions

### Oversampling

Methods to oversample the minority class: [racog](#), [wracog](#), [rwo](#), [pdfos](#), [mwmote](#)

**Evaluation**

Method to measure imbalance ratio in a given two-class dataset: [imbalanceRatio](#).

Method to visually evaluate algorithms: [plotComparison](#).

**Filtering**

Methods to filter oversampled instances [neater](#).

---

imbalanceRatio	<i>Compute imbalance ratio of a binary dataset</i>
----------------	--

---

**Description**

Given a two-class dataset, it computes its imbalance ratio as  $\{\text{Size of minority class}\}/\{\text{Size of majority class}\}$

**Usage**

```
imbalanceRatio(dataset, classAttr = "Class")
```

**Arguments**

dataset	A target data.frame to compute its imbalance ratio
classAttr	A character containing the class name attribute.

**Value**

A real number in [0,1] representing the imbalance ratio of dataset

**Examples**

```
data(glass0)

imbalanceRatio(glass0, classAttr = "Class")
```

---

iris0	<i>Imbalanced binary iris dataset</i>
-------	---------------------------------------

---

**Description**

Modification of [iris](#) dataset. Measurements in centimeters of the variables sepal length and width and petal length and width, respectively, for 50 flowers from each of 3 species of iris. The possible classifications are positive (setosa) and negative (versicolor + virginica).

**Usage**

```
iris0
```

**Format**

A data frame with 150 instances, 50 of which belong to positive class, and 5 variables:

**SepalLength** Measurement of sepal length, in cm. Continuous attribute.

**SepalWidth** Measurement of sepal width, in cm. Continuous attribute.

**PetalLength** Measurement of petal length, in cm. Continuous attribute.

**PetalWidth** Measurement of petal width, in cm. Continuous attribute.

**Class** Two possible classes: positive (setosa) and negative (versicolor + virginica).

**Source**

[KEEL Repository](#).

---

mwmote	<i>Majority weighted minority oversampling technique for imbalance dataset learning</i>
--------	---

---

**Description**

Modification for SMOTE technique which overcomes some of the problems of the SMOTE technique when there are noisy instances, in which case SMOTE would generate more noisy instances out of them.

**Usage**

```

mwmote(
  dataset,
  numInstances,
  kNoisy = 5,
  kMajority = 3,
  kMinority,
  threshold = 5,
  cmax = 2,
  cclustering = 3,
  classAttr = "Class"
)

```

**Arguments**

dataset	data.frame to treat. All columns, except classAttr one, have to be numeric or coercible to numeric.
numInstances	Integer. Number of new minority examples to generate.
kNoisy	Integer. Parameter of euclidean KNN to detect noisy examples as those whose whole kNoisy-neighbourhood is from the opposite class.
kMajority	Integer. Parameter of euclidean KNN to detect majority borderline examples as those who are in any kMajority-neighbourhood of minority instances. Should be a low integer.
kMinority	Integer. Parameter of euclidean KNN to detect minority borderline examples as those who are in the kMinority-neighbourhood of majority borderline ones. It should be a large integer. By default if not parameter is fed to the function, $ S^+ /2$ where $S^+$ is the set of minority examples.
threshold	Numeric. A positive real indicating how much we measure tolerance of closeness to the boundary of minority boundary examples. A large integer indicates more margin of distance for a example to be considered important boundary one.
cmax	Numeric. A positive real indicating how much we measure tolerance of closeness to the boundary of minority boundary examples. The larger this number, the more we are valuing boundary examples.
cclustering	Numeric. A positive real for tuning the output of an internal clustering. The larger this parameter, the more area focused is going to be the oversampling.
classAttr	character. Indicates the class attribute from dataset. Must exist in it.

**Value**

A data.frame with the same structure as dataset, containing the generated synthetic examples.

**References**

Barua, Sukarna; Islam, Md.M.; Yao, Xin; Murase, Kazuyuki. Mwmote—majority Weighted Minority Oversampling Technique for Imbalanced Data Set Learning. *IEEE Transactions on Knowledge and Data Engineering* 26 (2014), Nr. 2, p. 405–425

**Examples**

```
data(iris0)

# Generates new minority examples
newSamples <- mwmote(iris0, numInstances = 100, classAttr = "Class")
```

---

neater

*Filtering of oversampled data based on non-cooperative game theory*

---

**Description**

Filters oversampled examples from a binary class dataset using game theory to find out if keeping an example is worthy enough.

**Usage**

```
neater(
  dataset,
  newSamples,
  k = 3,
  iterations = 100,
  smoothFactor = 1,
  classAttr = "Class"
)
```

**Arguments**

dataset	The original data.frame. All columns, except classAttr one, have to be numeric or coercible to numeric.
newSamples	A data.frame containing the samples to be filtered. Must have the same structure as dataset.
k	Integer. Number of nearest neighbours to use in KNN algorithm to rule out samples. By default, 3.
iterations	Integer. Number of iterations for the algorithm. By default, 100.
smoothFactor	A positive numeric. By default, 1.
classAttr	character. Indicates the class attribute from dataset and newSamples. Must exist in them.

**Details**

Uses game theory and Nash equilibriums to calculate the minority examples probability of trully belonging to the minority class. It discards examples which at the final stage of the algorithm have more probability of being a majority example than a minority one.

**Value**

Filtered samples as a `data.frame` with same structure as `newSamples`.

**References**

Almogahed, B.A.; Kakadiaris, I.A. Neater: Filtering of Over-Sampled Data Using Non-Cooperative Game Theory. *Soft Computing* 19 (2014), Nr. 11, p. 3301–3322.

**Examples**

```
data(iris0)

newSamples <- smotefamily::SMOTE(iris0[,-5], iris0[,5])$syn_data
# SMOTE overrides Class attr turning it into class
# and dataset must have same class attribute as newSamples
names(newSamples) <- c(names(newSamples)[-5], "Class")

neater(iris0, newSamples, k = 5, iterations = 100,
       smoothFactor = 1, classAttr = "Class")
```

---

newthyroid1

*Imbalanced binary thyroid gland data*

---

**Description**

Data to predict patient's hyperthyroidism.

**Usage**

```
newthyroid1
```

**Format**

A data frame with 215 instances, 35 of which belong to positive class, and 6 variables:

**T3resin** T3-resin uptake test, percentage. Discrete attribute.

**Thyroxin** Total Serum thyroxin as measured by the isotopic displacement method. Continuous attribute.

**Triiodothyronine** Total serum triiodothyronine as measured by radioimmuno assay. Continuous attribute.

**Thyroidstimulating** Basal thyroid-stimulating hormone (TSH) as measured by radioimmuno assay. Continuous attribute.

**TSH\_value** Maximal absolute difference of TSH value after injection of 200 micro grams of thyrotropin-releasing hormone as compared to the basal value. Continuous attribute.

**Class** Two possible classes: positive as hyperthyroidism, negative as non hyperthyroidism.

**Source**

[KEEL Repository](#).

**See Also**

Original available in [UCI ML Repository](#).

---

oversample	<i>Wrapper that encapsulates a collection of algorithms to perform a class balancing preprocessing task for binary class datasets</i>
------------	---

---

**Description**

Wrapper that encapsulates a collection of algorithms to perform a class balancing preprocessing task for binary class datasets

**Usage**

```
oversample(
  dataset,
  ratio = NA,
  method = c("RACOG", "wRACOG", "PDFOS", "RWO", "ADASYN", "ANSMOTE", "SMOTE", "MWMOTE",
    "BLSMOTE", "DBSMOTE", "SLMOTE", "RSLSMOTE"),
  filtering = FALSE,
  classAttr = "Class",
  wrapper = c("KNN", "C5.0"),
  ...
)
```

**Arguments**

dataset	A binary class data.frame to balance.
ratio	Number between 0 and 1 indicating the desired ratio between minority examples and majority ones, that is, the quotient size of minority class/size of majority class. There are methods, such as ADASYN or wRACOG to which this parameter does not apply.
method	A character corresponding to method to apply. Possible methods are: RACOG, wRACOG, PDFOS, RWO, ADASYN, ANSMOTE, SMOTE, MWMOTE, BLSMOTE, DBSMOTE, SLMOTE, RSLSMOTE
filtering	Logical (TRUE or FALSE) indicating wheter to apply filtering of oversampled instances with <a href="#">neater</a> algorithm.
classAttr	character. Indicates the class attribute from dataset. Must exist in it.
wrapper	A character corresponding to wrapper to apply if selected method is <a href="#">wracog</a> . Possibilities are: "C5.0" and "KNN".
...	Further arguments to apply in selected method

**Value**

A balanced `data.frame` with same structure as `dataset`, containing both original instances and new ones

**Examples**

```
data(glass0)

# Oversample glass0 to get an imbalance ratio of 0.8
imbalanceRatio(glass0)
# 0.4861111
newDataset <- oversample(glass0, ratio = 0.8, method = "MWMOTE")
imbalanceRatio(newDataset)
newDataset <- oversample(glass0, method = "ADASYN")
newDataset <- oversample(glass0, ratio = 0.8, method = "SMOTE")
```

---

pdfos

*Probability density function estimation based oversampling*

---

**Description**

Generates synthetic minority examples for a numerical dataset approximating a Gaussian multivariate distribution which best fits the minority data.

**Usage**

```
pdfos(dataset, numInstances, classAttr = "Class")
```

**Arguments**

<code>dataset</code>	<code>data.frame</code> to treat. All columns, except <code>classAttr</code> one, have to be numeric or coercible to numeric.
<code>numInstances</code>	Integer. Number of new minority examples to generate.
<code>classAttr</code>	character. Indicates the class attribute from <code>dataset</code> . Must exist in it.

**Details**

To generate the synthetic data, it approximates a normal distribution with mean a given example belonging to the minority class, and whose variance is the minority class variance multiplied by a constant; that constant is computed so that it minimizes the mean integrated squared error of a Gaussian multivariate kernel function.

**Value**

A `data.frame` with the same structure as `dataset`, containing the generated synthetic examples.

Gao, Ming; Hong, Xia; Chen, Sheng; Harris, Chris J.; Khalaf, Emad. Pdfos: Pdf Estimation Based Oversampling for Imbalanced Two-Class Problems. *Neurocomputing* 138 (2014), p. 248–259

Silverman, B. W. *Density Estimation for Statistics and Data Analysis*. Chapman & Hall, 1986. – ISBN 0412246201

## Examples

```
data(iris0)

newSamples <- pdfos(iris0, numInstances = 100, classAttr = "Class")
```

---

plotComparison	<i>Plots comparison between the original and the new balanced dataset.</i>
----------------	--

---

## Description

It plots a grid of one to one variable comparison, placing the former dataset graphics next to the balanced one, for each pair of attributes.

## Usage

```
plotComparison(dataset, anotherDataset, attrs, cols = 2, classAttr = "Class")
```

## Arguments

dataset	A data.frame. The former imbalanced dataset.
anotherDataset	A data.frame. The balanced dataset. dataset and anotherDataset must have the same columns.
attrs	Vector of character. Attributes to compare. The function generates each possible combination of attributes to build the comparison.
cols	Integer. It indicates the number of columns of resulting grid. Must be an even number. By default, 2.
classAttr	character. Indicates the class attribute from dataset. Must exist in it.

## Value

Plot of 2D comparison between the variables.

**Examples**

```
data(iris0)
set.seed(12345)

rwoSamples <- rwo(iris0, numInstances = 100)
rwoBalanced <- rbind(iris0, rwoSamples)
plotComparison(iris0, rwoBalanced, names(iris0), cols = 2, classAttr = "Class")
```

---

 racog

*Rapidly converging Gibbs algorithm.*

---

**Description**

Allows you to treat imbalanced discrete numeric datasets by generating synthetic minority examples, approximating their probability distribution.

**Usage**

```
racog(dataset, numInstances, burnin = 100, lag = 20, classAttr = "Class")
```

**Arguments**

dataset	data.frame to treat. All columns, except classAttr one, have to be numeric or coercible to numeric.
numInstances	Integer. Number of new minority examples to generate.
burnin	Integer. It determines how many examples generated for a given one are going to be discarded firstly. By default, 100.
lag	Integer. Number of iterations between new generated example for a minority one. By default, 20.
classAttr	character. Indicates the class attribute from dataset. Must exist in it.

**Details**

Approximates minority distribution using Gibbs Sampler. Dataset must be discretized and numeric. In each iteration, it builds a new sample using a Markov chain. It discards first burnin iterations, and from then on, each lag iterations, it validates the example as a new minority example. It generates  $d(iterations - burnin)/lag$  where  $d$  is minority examples number.

**Value**

A data.frame with the same structure as dataset, containing the generated synthetic examples.

**References**

Das, Barnan; Krishnan, Narayanan C.; Cook, Diane J. Racog and Wracog: Two Probabilistic Oversampling Techniques. IEEE Transactions on Knowledge and Data Engineering 27(2015), Nr. 1, p. 222–234.

## Examples

```
data(iris0)

# Generates new minority examples

newSamples <- racog(iris0, numInstances = 40, burnin = 20, lag = 10,
                    classAttr = "Class")

newSamples <- racog(iris0, numInstances = 100)
```

---

rwo

*Random walk oversampling*

---

## Description

Generates synthetic minority examples for a dataset trying to preserve the variance and mean of the minority class. Works on every type of dataset.

## Usage

```
rwo(dataset, numInstances, classAttr = "Class")
```

## Arguments

dataset	data.frame to treat. All columns, except classAttr one, have to be numeric or coercible to numeric.
numInstances	Integer. Number of new minority examples to generate.
classAttr	character. Indicates the class attribute from dataset. Must exist in it.

## Details

Generates numInstances new minority examples for dataset, adding to the each numeric column of the j-th example its variance scaled by the inverse of the number of minority examples and a factor following a  $N(0, 1)$  distribution which depends on the example. When the column is nominal, it uses a roulette scheme.

## Value

A data.frame with the same structure as dataset, containing the generated synthetic examples.

## References

Zhang, Huaxiang; Li, Mingfang. Rwo-Sampling: A Random Walk Over-Sampling Approach To Imbalanced Data Classification. Information Fusion 20 (2014), p. 99–116.

**Examples**

```
data(iris0)

newSamples <- rwo(iris0, numInstances = 100, classAttr = "Class")
```

---

**trainWrapper***Generic methods to train classifiers*

---

**Description**

Generic methods to train classifiers

**Usage**

```
trainWrapper(wrapper, train, trainClass, ...)
```

**Arguments**

wrapper	the wrapper instance
train	data.frame of the train dataset without the class column
trainClass	a vector containing the class column for train
...	further arguments for wrapper

**Value**

A model which is [predict](#) callable.

**See Also**

[predict](#)

**Examples**

```
myWrapper <- structure(list(), class="C50Wrapper")
trainWrapper.C50Wrapper <- function(wrapper, train, trainClass){
  C50::C5.0(train, trainClass)
}
```

---

wisconsin

*Imbalanced binary breast cancer Wisconsin dataset*

---

### Description

Binary class dataset containing traits about patients with cancer. Original dataset was obtained from the University of Wisconsin Hospitals, Madison from Dr. William H. Wolberg.

### Usage

wisconsin

### Format

A data frame with 683 instances, 239 of which belong to positive class, and 10 variables:

**ClumpThickness** Discrete attribute.

**CellSize** Discrete attribute.

**CellShape** Discrete attribute.

**MarginalAdhesion** Discrete attribute.

**EpithelialSize** Discrete attribute.

**BareNuclei** Discrete attribute.

**BlandChromatin** Discrete attribute.

**NormalNucleoli** Discrete attribute.

**Mitoses** Discrete attribute.

**Class** Two possible classes: positive (cancer) and negative (not cancer).

### Source

[KEEL Repository](#).

### See Also

Original available in [UCI ML Repository](#).

---

 wracog

*Wrapper for rapidly converging Gibbs algorithm.*

---

### Description

Generates synthetic minority examples by approximating their probability distribution until sensitivity of wrapper over validation cannot be further improved. Works only on discrete numeric datasets.

### Usage

```
wracog(
  train,
  validation,
  wrapper,
  slideWin = 10,
  threshold = 0.02,
  classAttr = "Class",
  ...
)
```

### Arguments

train	data.frame. A initial dataset to generate first model. All columns, except classAttr one, have to be numeric or coercible to numeric.
validation	data.frame. A dataset to compare results of consecutive classifiers. Must have the same structure of train.
wrapper	An S3 object. There must exist a method <code>trainWrapper</code> implemented for the class of the object, and a <code>predict</code> method implemented for the class of the model returned by <code>trainWrapper</code> . Alternatively, it can be the name of one of the wrappers distributed with the package, "KNN" or "C5.0".
slideWin	Number of last sensitivities to take into account to meet the stopping criteria. By default, 10.
threshold	Threshold that the last <code>slideWin</code> sensitivities mean should reach. By default, 0.02.
classAttr	character. Indicates the class attribute from train and validation. Must exist in them.
...	further arguments for wrapper.

### Details

Until the last `slideWin` executions of wrapper over validation dataset reach a mean sensitivity lower than `threshold`, the algorithm keeps generating samples using Gibbs Sampler, and adding misclassified samples with respect to a model generated by a former train, to the train dataset. Initial model is built on initial train.

**Value**

A data.frame with the same structure as train, containing the generated synthetic examples.

**References**

Das, Barnan; Krishnan, Narayanan C.; Cook, Diane J. Racog and Wracog: Two Probabilistic Over-sampling Techniques. IEEE Transactions on Knowledge and Data Engineering 27(2015), Nr. 1, p. 222–234.

**Examples**

```
data(haberman)

# Create train and validation partitions of haberman
trainFold <- sample(1:nrow(haberman), nrow(haberman)/2, FALSE)
trainSet <- haberman[trainFold, ]
validationSet <- haberman[-trainFold, ]

# Defines our own wrapper with a C5.0 tree
myWrapper <- structure(list(), class="TestWrapper")
trainWrapper.TestWrapper <- function(wrapper, train, trainClass){
  C50::C5.0(train, trainClass)
}

# Execute wrACOG with our own wrapper
newSamples <- wracog(trainSet, validationSet, myWrapper,
  classAttr = "Class")

# Execute wrACOG with predefined wrappers for "KNN" or "C5.0"
KNNSamples <- wracog(trainSet, validationSet, "KNN")
C50Samples <- wracog(trainSet, validationSet, "C5.0")
```

---

yeast4

*Imbalanced binary yeast protein localization sites*

---

**Description**

Imbalanced binary dataset containing protein traits for predicting their cellular localization sites.

**Usage**

```
yeast4
```

**Format**

A data frame with 1484 instances, 51 of which belong to positive class, and 9 variables:

**Mcg** McGeoch's method for signal sequence recognition. Continuous attribute.

**Gvh** Von Heijne's method for signal sequence recognition. Continuous attribute.

**Alm** Score of the ALOM membrane spanning region prediction program. Continuous attribute.

**Mit** Score of discriminant analysis of the amino acid content of the N-terminal region (20 residues long) of mitochondrial and non-mitochondrial proteins. Continuous attribute.

**Erl** Presence of "HDEL" substring (thought to act as a signal for retention in the endoplasmic reticulum lumen). Binary attribute. Discrete attribute.

**Pox** Peroxisomal targeting signal in the C-terminus. Continuous attribute.

**Vac** Score of discriminant analysis of the amino acid content of vacuolar and extracellular proteins. Continuous attribute.

**Nuc** Score of discriminant analysis of nuclear localization signals of nuclear and non-nuclear proteins. Continuous attribute.

**Class** Two possible classes: positive (membrane protein, uncleaved signal), negative (rest of localizations).
